Problem Description

What are the functions of fit APs?

Solution

A fit AP provides the following functions:

- Provides communications from wireless clients to a wired network.
- Transfers packet formats between 802.3 and 802.11.
- Encrypts data frames and control frames through WEP, TKIP, or CCMP.
- Buffers data and forwards packets based on QoS configuration.
- Scans working channels to locate wireless clients and detect rogue APs and ad hoc clients.
- Automatically obtains configurations from the associated AC.
