Problem Description

null

Solution

A weak signal client is connected to the same AP. Since the AP works in half-duplex mode, it can only receive or send messages at the same time. At this time, a portion of the time will be allocated to weak signal clients, occupying a large amount of air interface resources. So we can enable Low rate prohibited access: [AC_02-wlan-rrm]dot11g disabled-rate 1 2 6 9
