IMC - S7506E - WX3540 - AP - Terminal

Portal non-perceptual authentication is configured on site, and it can be authenticated normally and g o online, but the terminal needs to be authenticated again after the screen is turned off.

Check the configuration found:

interface Vlan-interface340 ip address 10.6.37.254 255.255.255.0 portal enable method direct portal apply web-server portal

wlan service-template 1 ssid HDDS vlan 340 portal bas-ip 192.168.1.241 portal apply mac-trigger-server mts service-template enable

The non-sense-related configuration is under the wireless service template, and the portal is configur ed under the vlan interface, resulting in the non-sense service not taking effect.

Unify portal and mac-trigger configuration under service template or vlan interface.
