Problem Description

What is the relationship between AP management VLAN, AC management VLAN, and Wireless user service VLAN?

Solution

There is no relationship between these three VLANs . First of all, the management VLAN of the AP is used by the AP to access the network, and the management VLAN of the AC is used by the AC to access the network. It is required that the management address of the AP and the management address of the AC must be routed. The Wireless user service VLAN is determined by the AC, but it is only used for Layer 2 transparent transmission. When a Wireless user is online, the logical topology can be regarded as the wireless user is connected to the AC with a network cable and the AC is used as a layer 2 switch.
