Problem Description

How to know whether the AP is an outdoor device or an indoor device, a single radio frequency card or a dual radio frequency card, and the power of the G card from its name?

Solution

Take WA2220X-AGP as an example, if the model is "X", it means outdoor type, otherwise it is indoor type. Single radio frequency card or dual radio frequency card look at the third digit from left to right. If the number is 1, it is single card. If the number is 2, it is dual card. The power of G card depends on the last letter, if there is P or E, it is 500mw, otherwise it is 100mw.
