Problem Description

What is automatic registration?

Solution

This mode is mainly used in sites where the number of APs is large and the construction period is tight. The configuration method is to enable the automatic registration function globally ("wlan auto-ap enable"), create a service template for each type of AP, and set the serial-id to auto. After the AP is successfully registered, use the "display wlan ap all" command to view the AP registration status as RUN. Then execute automatic registration and solidification configuration under the global: "wlan auto-ap persistent all". In this way, the automatically registered AP can modify the configuration.
