null

Terminals above Apple IOS11 will negotiate large packets when sending some tcp messages, and large packets are prone to packet loss due to intermediate links in the transmission network. Configur e the $mac\text{-}forwarding\ tcp\ mss\ 1100\ \text{command}$ on the AC. This command means to configure the m aximum TCP packet length. The default is 1392 bytes. After the configuration, the fault disappears.
