

F5030 IPSEC起来, 访问ipsec业务不通

IPSec VPN

组网及说明

F5030----10.1.1.1----20.2.2.2---- F1000-AI-60 起ipsec。

问题描述

测试连通性公网地址可达，通过display ike sa、display ipsec sa 查看 ipsec已起来，查看配置无问题，访问2侧本端业务都正常，但是访问对端web业务（走ipsec）时一直转圈圈

过程分析

通过display ipsec statistics 查看报文被MTU 丢弃。

```
display ipsec statistics
```

```
Received/sent packet rate: 5/5 packets/sec
```

```
Received/sent byte rate: 290/290 bytes/sec
```

```
Dropped packets (received/sent): 0/45
```

```
Dropped packets statistics
```

```
No available SA: 0
```

```
Wrong SA: 0
```

```
ACL check failure: 0
```

```
MTU check failure: 45
```

后续通过display ipsec sa 查看 路径MTU 1424

```
display ipsec sa
```

```
-----  
Interface: GigabitEthernet1/0/1
```

```
Tunnel id: 3
```

```
Encapsulation mode: tunnel
```

```
Perfect Forward Secrecy:
```

```
Inside VPN: vp1
```

```
Extended Sequence Numbers enable: Y
```

```
Traffic Flow Confidentiality enable: N
```

```
Transmitting entity: Initiator
```

```
Path MTU: 1424
```

解决方法

由于display ipsec sa 查看的 通道MTU值无法修改 (path mtu) , 此时修改内网接口 (感兴趣流上来的接口) tcp mss 值, 修改的幅度: 每次减30的进行调整。后续修改内网接口tcp mss 后业务访问正常
