问题描述

设备MSR3620在出口位置，做了NAT Server，将内网一台服务器映射到公网，服务器提供了WEB服务，在WEB上可以访问服务器上的虚机，虚机地址和服务器地址一样，但是端口不同

```
interface Ten-GigabitEthernet0/X
ip address X.X.X.X 255.255.255.252
nat outbound
nat server protocol tcp global current-interface A inside 192.168.1.D 443
nat server protocol tcp global current-interface B inside 192.168.1.D Y
nat server protocol tcp global current-interface C inside 192.168.1.D Z
```

在公网访问测试，能打开WEB界面，但是访问WEB上的虚机时无法连接。

过程分析

在内网通过WEB界面访问虚机正常，说明服务器是正常的，虚机也是正常的，在设备debug，看到访问过程是正常的：

```
<H3C>*Nov 18 19:07:26:139 2024 H3C IPFW/7/IPFW_PACKET:

```
Sending, interface = Ten-GigabitEthernet0/X  
version = 4, headlen = 20, tos = 0  
pktlen = 52, pktid = 0, offset = 0, ttl = 63, protocol = 6  
checksum = 17138, s = X.X.X.X, d = 221.12.4.143  
channelID = 0, vpn-InstanceIn = 0, vpn-InstanceOut = 0.  
VsysID = 1  
prompt: Sending IP packet received from interface Vlan-interface1 at interface Ten-GigabitEthernet0/  
X.  
Payload: TCP  
source port = B, destination port = 62060  
sequence num = 0xca824f67, acknowledgement num = 0xc042781a, flags = 0x12  
window size = 29200, checksum = 0xf81b, header length = 32.
```

进一步在内网测试，发现通过软件登录时，使用了443端口，而非Y端口，所以怀疑通过WEB访问时，被重定向到了一个内网端口，从公网发起访问时，没有访问到真正的服务，为验证猜测，在接口下新增如下配置，转换时端口不变，新增配置后测试访问正常。

```
nat server protocol tcp global current-interface Y inside 192.168.1.D Y  
nat server protocol tcp global current-interface Z inside 192.168.1.D Z
```

解决方法

内网服务器WEB上访问虚机经过了一次端口跳转，且跳转的是内网真实端口，所以该端口也需要在公网进行映射。
