How is the CF Card Log Writing of S9500

孟维佳　2007-01-23 发表

After a log is generated, it is saved in the cache rather than writing to the CF card log file immediately. S9500 provides two ways to write a logfile:

Log memory cache is full. S9500 can save up to 100K log information in the cache. When the cache is full, it writes in a CF card log file.

Manual writing. In system model perform the info-center logfile flush command to write the information in the cache to a log file.

Note: the offline command umount cannot write the log information to the CF card.
