

How to Configure Traffic Shaping

刘志伟 2007-01-25 发表

Traffic shaping is to control traffic output rate so that packets can be output at an even rate. With traffic shaping, the outbound rate can be restricted. Traffic shaping applies only to a port, rather than a specific outbound flow.

Enter port view to configure traffic shaping:

```
[S9500] interface Ethernet 3/1/1
```

```
[S9500-Ethernet3/1/1] traffic-shape 650 12
```

Note: For low speed network (less than 1000M), the maximum rate must be no less than 500K, and for high speed network (1000M and above), the maximum rate must be no less than 40000K.
