

## Function and Configuration of Blackhole Routes

刘志伟 2007-01-25 发表

Blackhole routes: When a static route to some destination is characterized as blackhole, it is destined to interface NULL 0 and dropped without advertising the source host, whatever the next hop address is. When the network is attacked, the packets to the destination can be dropped with the configuration of blackhole route:

```
<S9500>system-view  
[S9500]ip route-static 1.1.1.1 32 null 0 blackhole
```
