

知 CPU Occupation Is High when Logging S9500 with Telnet for Querying

刘志伟 2007-01-25 发表

When logging S9500 with telnet from the host, any operation involves packet-exchanging. The CPU of S9500 will process the TCP packets received and encapsulate the related information and forward the packet to the host. If the operation involves a lot of information (such as the query operation), the times of S9500 CPU receiving packets will increase and the CPU may be busy for a time. So the CPU occupation may be high.
