

知 Is the Selection of the Active Port Based on the Physical Port or the Subscriber Port During Link Aggregation of the S9500 Series

孟维佳 2007-01-31 发表

Each visible port corresponds to a physical port on the PP, as illustrated in the following figure:

Upon link aggregation, choice of the active port is based on the subscriber port. If you use the command **link-aggregation Ethernet 4/1/1 to Ethernet 4/1/5 both** to conduct port aggregation, the active port is Ethernet 4/1/1 whose port No. is the smallest. While sending packets outbound, select the port with the smallest physical port number. As the physical ports and the logical ports are not numbered in the same order, the port to send the packets may not be the primary port.
