

## Queue Scheduling Mechanism of the S9500 Port

孟维佳 2007-02-06 发表

Each physical port has 8 sending queues, and queue 7 has the highest priority while queue 0 has the lowest priority. The queue scheduling modes supported by the sending port include SP and WRR (WRR supports two groups WRR1 and WRR2, without priority discrimination) and mixed scheduling of SP and WRR. Mixed scheduling takes a queue from each group for scheduling according to the strict priority. The priority of the WRR group is determined by the lowest priority of the queue in the group.
