

MAC Address Entry Aging Time and Aging Mechanism

孟维佳 2007-02-27 发表

MAC address entry aging time is defaulted to 5 minutes and can be modified with the **mac-address timer aging** command.

MAC address aging time update mechanism: When a port receives a data stream, the port dynamically learns its MAC address. If the data stream continues existing, the MAC address aging time is updated all the time so that the MAC address will not be aged. However, when the data stream stops, the MAC address will be aged out after the specific aging time.

At present, the remained aging time of a dynamic MAC address cannot be queried.
