Q: Why does the configuration fail to be deleted on mid-range routers (V1.74-0 105)?

A: New options are added for the commands of deleting configuration and rebooting on the mid-range router (V1.74-0105). If you neglect them, you may find that the origi nal configuration still exists after running the **delete** and **reboot** commands. For exa mple:

[Router]delete

　This will erase the configuration in NVRAM.

　The router configurations will be erased to reconfigure

　Are you sure?[Y/N]y

　Now erasing the configuration in nvram.

　Please wait for a while......

　Erase the configuration in NVRAM successfully

　Please reboot the router

[Router]reboot

　WARNING: Configuration has been changed ! Save configuration ? [Y/N]y

　Now writing the running config to nvram .

　Please wait for a while......

　write the running config to nvram successfully

　WARNING: System will REBOOT! Continue ?[Y/N]y

System is now rebooting, please wait

While rebooting the system, you are prompted whether to save the configuration. If y ou choose **Yes**, the configuration still exists after reboot. If you choose **No**, there are no problems.
