What's the difference of binding PPP MP between virtual-Template and MP-Group?

Q: what the difference of binding PPP MP between virtual-Template and MP-Group?

A:

Virtual-Template is more flexible, which not only can bind many interfaces directly, but also can complete P2P application to dynamically bind according to PPP link's RAP or Chap user name. MP-Group can only implement bind many interfaces directly, which can not complete P2P configuration. In a word, Virtual-Template is flexible, but MP-Group is more effective.
