The implement of dial-prefix and send-number in VE1/VT1

Q: what's the implement of dial-prefix and send-number in VE1/VT1?
A:
See the configuration as below.
```
 #
entity 10002 pots
 dial-prefix 013
 line 7/1:15
 match-template 01013.........
 #
```
Call 01013123456789 to match the entity, if it doesn't configure send-number all and dial-prefix, which will send 123456789 to line 7/1:15. (".....") If add dia-prefix 013, it will send 013123456789(add 013 to prefix). By default, VE1/VT1 send number according to Truncate method. ("." represent for number) If you want to send all numbers, you should configure send-number all. User can configure freely according to need.
