

The Out-band Transmission In MSR Series

Keywords:MSR;Out-band Transmission

Q: What is Out-band Transmission in MSR Series ?

A:

Normally, when we make an IP call, we will dial a chain of number first, such as 17910, there will be a voice sounds up: Please input....., then any number that you dial all belong to DTMF code. It not a single voice transfer. If this signal is modulated with voice signal and send out, we call it In-band transmission, therefore, Out-band transmission is set up another tunnel for this DTMF signal.
