问题描述

V7设备启动显示<boot>命令不全问题

解决方法

下图，设备启动过程有类似报错信息，能进入命令行但是命令不全，只有系统性的命令，且系统名称显示为< boot >：

```
Image file flash:/s5560ei-caw710-boot-r1122p02.bin is self-decompressing.....
.....
..... Done.
System is starting.
/etc/pkg/esh/mount.sh: line 7: can't create /sys/module/msgring/parameters/irq_dispatching: nonexistent directory
<boot>
<boot>
<boot?>
User view commands:
copy       Copy a file
delete     Delete a file
dir        List files or folders
display    Display current system information
format     Format the storage medium
install    Perform package management operation
mkdir      Create a new directory
more       Display the contents of a file
move       Move a file
pwd        Display the current path
reboot     Reboot system
rmdir     Remove an existing directory
system-view Enter system view
```

此为system.bin版本文件异常损坏或丢失导致系统软件特性包未正常加载导致（正常会加载boot.bin启动软件包和system.bin软件特性包），需要CTRL+B进入bootrom菜单重新刷下ipe版本即可，否则会一直自动重启。
